

Capstone Project: MindGuard AI

Name: Ankita Mukund Panpatil

Deliverable: Final Capstone Project Report (Module 6)

Industry Selected: Healthcare & Mental Wellness

1. Problem & Context

The Problem: Mental healthcare systems experience severe accessibility barriers, high financial costs, and rigid scheduling that fails to accommodate acute stress or after-hours anxiety crises.

The User: Busy professionals, students, and individuals navigating chronic stress or mild-to-moderate anxiety who require immediate, low-barrier emotional support.

Why Emotion Matters: Emotional states (such as escalating frustration or hidden burnout) dictate whether an individual seeks help early. Catching distress signals early prevents clinical escalation.

2. Your Solution (MindGuard AI)

System Overview: MindGuard is an empathetic AI conversational agent designed to analyze user text messages and conversational sentiment in real time, delivering personalized coping strategies and validation.

Component	Description
Emotional Signals	Natural Language Processing (DistilBERT) analyzing textual sentiment, emotional valence, and keywords associated with anxiety or burnout.
System Response	Dynamic dialogue adaptation via Google Dialogflow, providing empathetic validation, guided breathing prompts, or professional escalation.

3. User Experience & Interaction Design

Interaction Flow: Users interact via a secure chat interface. When the model detects high frustration or anxiety scores, it immediately shifts tone from standard assistance to compassionate de-escalation.

Advantage Over Existing Solutions: Unlike static meditation apps or generic chatbots, MindGuard actively listens to emotional tone, offering tailored, context-aware interventions rather than pre-recorded scripts.

4. Ethical Considerations

- **Privacy (GDPR & HIPAA Compliance):** All conversational data is encrypted in transit and at rest, with optional local processing to safeguard sensitive health disclosures.
- **Bias Reduction:** Model evaluation utilizing AI Fairness 360 (AIF360) ensures equitable emotion detection across diverse demographic groups and linguistic backgrounds.
- **Responsible Use:** The AI acts as a supportive triage tool, not a diagnostic clinician, featuring immediate crisis helpline triggers when severe distress is detected.

| 5. Impact & Value Creation

MindGuard creates immediate value by providing 24/7 mental health support, reducing societal stigma through judgment-free interactions, and alleviating overburdened healthcare systems by handling initial emotional triage effectively.
